The book presents background information and guidelines for caring for a box turtle, including selecting a health specimen, acclimating the turtle, indoor and outdoor housing, heating and lighting requirements, feeding and handling, hibernation and breeding. The authors recommend three specific species of box turtles as good pet candidates: they provide photos and information on ornate box turtles, common Asian box turtles, and Chinese box turtles. Dr. Klingenberg provides a chapter on diseases and disorders that gives specific advice about dealing with dehydration, nutritional problems, parasitic problems, and vitamin deficiency. This book presents four contributions to planning research within an integrated framework. James Allen offers a survey of his research in the field of temporal reasoning, and then describes a planning system formalized and implemented directly as an inference process in the temporal logic. Starting from the same logic, Henry Kautz develops the first formal specification of the plan recognition process and develops a powerful family of algorithms for plan recognition in complex situations. Richard Pelavin then extends the temporal logic with model operators that allow the representation to support reasoning about complex planning situations involving simultaneous interacting actions, and interaction with external events. Finally, Josh Tenenbergh introduces two different formalisms of abstraction in planning systems and explores the properties of these abstraction techniques in depth.

"Having been born a freeman, and for more than thirty years enjoyed the blessings of liberty in a free State—and having at the end of that time been kidnapped and sold into Slavery, where I remained, until happily rescued in the month of January, 1853, after a bondage of twelve years—it has been suggested that an account of my life and fortunes would not be uninteresting to the public." -an excerpt

It is remarkable that each month the quantity of articles published on AIDS still that address numbers in the thousands. The basic, clinical and sociological aspects this epidemic have been vigorously investigated, and equally as extensively reported in traditional as well as new journals. Therefore, what can the reader of this volume expect to find that is different from the information already found in the literature? The authors of this text met in October 1993 to discuss not only AIDS and its effects on the nervous system but also to address the problem from the point of view of the diverse technologies that are used in understanding the disease. Just as the recognition of oncogenic viruses gave us insights into cellular genes that govern growth, the study of HIV-1 in the nervous system has opened new areas of investigation in the nervous system. Use of human fetal and glioma-derived cell cultures, discovery of toxins in the nervous system, release and damage of cytokines in the brain, the neuropathic effects of HIV proteins, the investigation of new treatment for neuro AIDS, and virus detection strategies to identify latent HIV-1 infection are described in this volume. Basic and clinical investigators from more than thirty laboratories around the world contributed to the ideas discussed at the meeting, "Technical Advances in AIDS Research in the Human Nervous System.
