er of some harmful virus inside their computer. access to water in developing countries is open in our digital

Lack of access to safe water sources is a leading risk factor for infectious diseases, including cholera, diarrhoea, dysentery, hepatitis A, typhoid and polio. 2 It also exacerbates malnutrition, and in particular, childhood stunting. In the chart we see that it ranks as a very important risk factor for death globally.

Preventable water-related diseases still claim tens of thousands of lives, especially among children under five-years-old. World Water Day 2019, which will be observed on 22 March, underscores the

basic right of all citizens to health protection, through access to safely managed drinking-water supply and sanitation, and good hygiene behaviours.

Inadequate access to sanitation and clean water kills 4,000 vulnerable children each day. This contributes to the cycle of poverty for families and communities in developing countries. Without water, sanitation and hygiene, efficient and sustainable development is

unattainable. But the problem doesn't end there.

Goal 6 specifically aims to ensure access to water and sanitation for all, setting out the following objectives for joint action: improve the management and quality of water resources, involving communities and including women and girls ensure that people have access to safe and affordable drinking ...
