While anatomy studies the structure of the parts of an organism, physiology is concerned with the way those parts function together. For example, an anatomist may study the types of tissues found in different parts of the heart, while a physiologist may study how the heart regulates blood flow to supply oxygen to other organs in the body.

heart when the capillaries return blood to the venules and . then to the larger veins. The cardiovascular system, therefore, consists of a closed circuit: the

heart, arteries, arterioles, capillaries, venules, and veins (see . Figure 5-1). The venules . 36. CHAPTER 5 . Anatomy and Physiology of the Cardiovascular System

Recall that blood is a connective tissue. Like all connective tissues, it is made up of cellular elements and an extracellular matrix. The cellular elements—referred to as the formed elements—include red blood cells (RBCs), white blood cells (WBCs), and cell fragments called platelets. The extracellular matrix, called plasma, makes blood unique among connective tissues because it is fluid.
