Differential Equations and Boundary Value Problems: Computing and Modeling provides the conceptual development and geometric visualization of a modern differential equations course that is essential to science and engineering students. It balances traditional manual methods with the new, computer-based methods that illuminate qualitative phenomena — a comprehensive approach that makes accessible a wider range of more realistic applications.

Acclaimed authors Edwards and Penney combine core topics in elementary differential equations with those concepts and methods

of elementary linear algebra needed for a contemporary combined introduction to differential equations and linear algebra. Penney's primary contribution here was the development of a mathematical model (using simultaneous ordinary differential equations) for the metabolic phenomena regulating such transport, with potential future applications in kidney physiology, management of hypertension, and treatment of congestive heart failure.
