Some CAS (such as GAP which is a free and open-source academic research tool) are able to give you the Galois groups of low degree polynomials, as well as properties of splitting fields and you can look at their tutorial to have examples of their use. Effective and Inverse Galois Theory is still an active research subject.

Galois theory. Classical results by Abel, Gauss, Kronecker, Lagrange, Ruffini, and, of course, Galois are presented as background and motivation leading up to a modern treatment of Galois theory. The celebrated criterion due to Galois for the solvability of polynomials by radicals is presented in detail. The power of

**Classical Galois Theory With Examples**

Classical Galois Theory deals, in essence, with the solutions to polynomial equations. Its applications are spectacular, including the algebraic result that some polynomial equations of degree  $\geq 5$  can't be solved in radicals, and the geometrical result that the cube can't be doubled by ruler-and-compass constructions.

In Volume I, general deformation theory of the Floer cohomology is developed in both algebraic and geometric contexts. An essentially self-contained homotopy theory of filtered  $(A_\infty)$  algebras and  $(A_\infty)$  bimodules and applications of their obstruction-deformation theory to the Lagrangian Floer theory are presented.

For example, in algebraic number theory, one often does Galois theory using number fields, finite fields or local fields as the base field. It allows one to more easily study infinite extensions. Again this is important in algebraic number theory, where for example one often discusses the absolute Galois group of  $\mathbb{Q}$ , defined to be the Galois group of  $\mathbb{C}/\mathbb{Q}$  where  $\mathbb{C}$  is an algebraic closure of  $\mathbb{Q}$ .
