The transformation in the health care industry, begun over a decade ago, will continue well into the 21st century. And the dominant theme in the new millennium is likely to be collaborative practice and outcome s-based health care delivery. A collection of the most current and innovative presentations in path-based, collaborative practices, this book focuses on the design, implementation and analysis of outcomes for the heavy volume DRGs. For each DRG, the authors present two to three standard clinical pathways, and then show how those pathways can be manipulated to alter outcomes. Health Care Outcomes covers topics in Respiratory, Neonatal/Pediatric, General Surgery, Orthopaedic, and Geriatric Care. A comprehensive collection of critical pathways and outcomes maps being used by leading hospitals and health care agencies around the country, this is an important reference for developing path-based care models, or revising critical paths and outcomes maps.

Utilization management (UM) has become a strong trend in health care cost containment. Under UM, some decisions are not strictly made by the doctor and patient alone. Instead, they are now checked by a reviewer reporting to an employer or other paying party who asks whether or not the proposed type or location of care is medically necessary or appropriate. This book presents current findings about how UM is faring in practice and how it compares with other cost containment approaches, with recommendations for improving UM program administration and clinical protocols and for conducting further research.

Centers for Medicare and Medicaid Services (CMS) began implementing re-admission penalties on hospitals with heart failure (HF) re-admission rates above the national average this fiscal year. While many urban facilities have teamed together to provide collaborative resources, rural hospitals are especially mindful of how the patients are monitored during the course of their outpatient time, due to poor availability to specialty care and hard-to-obtain follow-up appointments. Research has shown that these patients are not adequately followed by their primary care physicians, are not receiving collaborative care from cardiologists and internists, as shown to be the best for managing the disease for the long-term, and that hospitalization time is not adequate enough to provide significant patient education to prevent re-admission. Using electronic medical records to implement rapid identification of HF patients for early teaching, identifying those at risk for unsafe discharge locations due to re-admission risk factors, using case management to provide discharge planning and schedule outpatient follow-up in the Resident Clinic will allow for a decrease in rural hospital re-admission rates and emergency room visits. Ensuring patient satisfaction and continued education at the outpatient clinic is also a long-term goal, combined with the lower re-admission rates, and as such, monitoring, evaluating and disseminating the trajectory of patient education for inpatient through outpatient is essential. Providing all stakeholder, staff, and community members' access to the clinic's results will increase the community's participation in accessing care closer to home- the basis of the rural hospital network.

This first-of-its-kind text provides a multidisciplinary overview of a significant problem in hospital-based healthcare: patients who decline inpatient medical care and leave the hospital against medical advice (AMA). Compared to standard hospital discharges, AMA discharges are associated with worse health and health services outcomes. Patients discharged AMA have been found to have disproportionately higher rates of substance use, psychiatric illness, and report stigmatization and reduced access to care. By providing a far reaching examination of AMA discharges for a wide academic and clinical audience, the book serves as a reference for clinical care, research, and the development of professional guidelines and institutional policy. The book provides both a broad overview of AMA discharges with chapters on the epidemiology, ethical and legal aspects, as well as social science perspectives. For clinicians in the disciplines of hospital medicine, pediatrics, emergency medicine, nursing, and psychiatry, the book also provides a patient-centered analysis of the problem, case-based discussions, and a discussion of best practices. This comprehensive review of AMA discharges and health care quality will interest physicians and other health care professionals, social workers, hospital administrators, quality and risk managers, clinician-educators, and health services researchers.

According to *Transforming Health Care Scheduling and Access*, long waits for treatment are a function of the disjointed manner in which most health systems have evolved to accommodate the needs and the desires of doctors and administrators, rather than those of patients. The result is a health care system that deploys its most valuable resource—highly trained personnel—inefficiently, leading to an unnecessary imbalance between the demand for appointments and the supply of open appointments. This study makes the case that by using the techniques of systems engineering, new approaches to management, and increased patient and family involvement, the current health care system can move forward to one with greater focus on the preferences of patients to provide convenient, efficient, and excellent health care without the need for costly investment. *Transforming Health Care Scheduling and Access* identifies best practices for making significant improvements in access and system-level change. This report makes recommendations for principles and practices to improve access by promoting efficient scheduling. This study will be a valuable resource for practitioners to progress toward a more patient-focused "How can we help you today?" culture.
