Mass transfer - Wikipedia

Heat capacity is the amount of energy (heat) needed to increase temperature of a substance by one degree. It reflects the capacity of the substance to retain heat. As defined, heat capacity has only a limited application since it is extensive property i.e. depends on mass of the substance. In Physics, specific heat ...

Mass transfer is the net movement of mass from one location, usually meaning stream, phase, fraction or component, to another. Mass transfer occurs in many processes, such as absorption, evaporation, drying, precipitation, membrane filtration, and distillation. Mass transfer is used by different scientific disciplines for different processes and mechanisms.

The Journal of Heat Transfer disseminates information of permanent interest in the areas of heat and mass transfer. Contributions may consist of results from fundamental research that apply to thermal energy or mass transfer in all fields of me-

chanical engineering and related disciplines.

Heat capacity or thermal capacity is a physical property of matter, defined as the amount of heat to be supplied to a given mass of a material to produce a unit change in its temperature.. The SI unit of heat capacity is joule per kelvin (J/K).. Heat capacity is an extensive property. The corresponding intensive property is the specific heat capacity. Dividing the heat capacity by the amount of ...
