HID® pivCLASS® RKCL40 | HID Global

2 HID Lamp Types . High Intensity Discharge lamps, as their name implies, produce a high level of light for their physical size by means of an electrical discharge. A controlled high intensity arc is maintained between two electrodes inside of a glass or ceramic tube, which is filled with gas and metal vapors.

HID bulbs produce light in a different manner than halogen lights. While halogen bulbs use tungsten filament to produce light, HID's use the ability of noble gasses to shine when subjected to electricity. More precisely, HID bulbs have Xenon trapped in a glass enclosure that lights up when an electric arc is introduced via two electrodes.

HIDextra offers a bulb guide on the website for more clarification if you need to see the bulb cross reference as certain bulbs will have different names or numbers assigned. Bulb cross reference guide can be found at this LINK HIDextra offers HID kits with various ballasts to choose from ranging from 35w up to 55w with CANBUS built-in.

Properly prioritising inspections is a high priority for HID in ensuring it delivers its major hazard strategy whilst supporting businesses to grow. Therefore HID's Energy Division Offshore aims to...

High-intensity discharge lamps (HID lamps) are a type of electrical gas-discharge lamp which produces light by means of an electric arc between tungsten electrodes housed inside a translucent or transparent fused quartz or fused alumina arc tube. This tube is filled with both gas and metal salts. The gas facilitates the arc's initial strike.
