BNF (Backus-Naur Form) is a syntactic metalanguage (i.e., a language about a language). The metalanguage is a formal notation for specifying the grammar that describes the syntax of a programming language.

In this video, Alastar decides to attempt to teach EBNF, a way of describing the grammar of languages. This tool is particularly useful because a finite grammar can describe a language which has ...

The rules part is written in an Extended Backus-Naur Form (EBNF). Rules are intended for both the parser, and for documentation purposes. The rules define how elements can be combined. Many combinations of the rules can be correct (depending of the grammar). When IntoTheCode parses code, the rules are applied.

In computer science, extended Backus-Naur form is a family of metasyntax notations, any of which can be used to express a context-free grammar. EBNF is used to make a formal description of a formal language such as a computer programming language. They are extensions of the basic Backus-Naur form metasyntax notation. The earliest EBNF was developed by Niklaus Wirth incorporating some of the concepts from Wirth syntax notation. However, many variants of EBNF are in use. The International ...

BNF and EBNF: What are they and how do they work?

Peter Naur, as editor of the ALGOL report, popularized this notation by using it to describe the complete syntax of ALGOL. In their honor, this notation is called Backus{ Naur Form (BNF). This book uses Extended Backus{Naur Form (EBNF) to describe Python syntax, because using it results in more compact descriptions.
