Psychology of Perception - an overview | ScienceDirect Topics

This study uses a novel theoretical framework, cognitive sociology, to examine social aspects of human perception in relation to task-based information seeking behavior, which

has been little understood theoretically and empirically in the field of information science.

Social cognitive theory was developed by Stanford psychologist Albert Bandura. The theory views people as active agents who both influence and are influenced by their environment. A major component of the theory is observational learning: the process of learning desirable and undesirable behaviors by observing others, then reproducing learned behaviors in order to maximize rewards.

Cognitive Computing (Perception, Learning, Reasoning) ... often following a rigid decision tree approach. But with today's wealth of big data and the need for more complex evidence-based decisions, such a rigid approach often breaks or fails to keep up with available information.

Psychologist Richard Gregory (1970) argued that perception is a constructive process which relies on top-down processing. Stimulus information from our environment is frequently ambiguous so to interpret it, we require higher cognitive information either from past experiences or stored knowledge in order to makes inferences about what we perceive.

The cognitive approach is an area of psychology that focuses on mental processes, perception, and language as a way of explaining and understanding human behavior. It started to develop in the 1960s, and by the end of the 20th century, it had become the dominant school of thought in psychology.
