The effective drum radius used in this calculation is the distance between the centreline of the active rope layer and the centreline of the drum. For winches with only one layer of rope this is a constant factor. For winches with multiple layers the distance is a variable, and depends on the amount of rope wound on the drum.

Preliminary discussion of Winch Design (still under construction) The first part of the discussion is directed to a winch design that uses a standard pulley type winch with a single pulley. A later section discusses the two drum winch for two way operation and the final section describes the rather more complex design required for a continuous two way winch design that would be used for a dome that had to be rotated continuously in either direction.
