### Spooky Computing - MIT Technology Review

John Preskill, the Richard P. Feynman Professor of Theoretical Physics, is himself deeply entangled in the quantum world. Different rules apply there, and objects that obey them are now being made in our world, as he explains at 8:00 p.m. on Wednesday, April 3, 2013, in Caltech's Beckman Auditorium.

In The Feynman Processor, quantum physicist Gerard J. Milburn describes the astounding principles of the quantum world that are about to revolutionize the world of computers - including a concept created by the legendary American physicist Richard Feynman, which proves that the most important principle in a quantum computer is that of probability amplitude, a rule that has become known as "Feynman's Rule."
