The acceleration can be calculated using Newton's second law of motion.  $a = F_{net} / m = (39.6 \text{ N, up}) / (4.44 \text{ kg}) = 8.92 \text{ m/s}^2$ , up  
The acceleration value can be used with other kinematic information ( $v_i = 0 \text{ m/s}$ ,  $t = 1.59 \text{ s}$ ) to calculate the final speed of the bucket.

An object in motion will stay in motion unless acted upon by an unbalanced force. OR Things keep moving or stay at rest, unless a net force acts upon them. Newton's Laws of Motion Law Two—  $F = ma$  The acceleration of an object is proportional to the force acting on it and inversely proportional to its mass.
